Perform IT Project Audit and generate a report using open-source tools.

Date:

AIM:

To perform an IT project audit using open-source tools by examining project activities, identifying risks and issues, evaluating compliance and performance, and generating a comprehensive audit report.

ALGORITHM:

- Start the open-source IT project auditing tool.
- Create or import the IT project to be audited.
- Collect project information such as scope, schedule, resources, cost, and deliverables.
- Define the audit criteria and objectives.
- Examine project documentation, processes, and activities.
- Identify risks, issues, deviations, and compliance gaps.
- Evaluate project performance against the defined criteria.
- Record audit findings with their severity and recommendations.
- Generate the IT project audit report containing findings, risks, and corrective actions.
- Review and save the final audit report, then stop.

PROCEDURE:

- Open the selected **open-source** IT project auditing tool and create a new audit project.
- Enter the project details such as **project name, objectives, team, timeline, and deliverables**.
- Define the **audit scope, objectives, and evaluation criteria**.
- Import or enter relevant project documents, task details, schedules, and resource information.
- Review the project activities and compare the actual progress with the planned progress.
- Check the project for **risks, security issues, quality problems, cost deviations, and schedule delays**.
- Record each identified finding and assign an appropriate **severity level** such as Low, Medium, or High.
- Provide suitable recommendations and corrective actions for the identified issues.

- Generate the IT Project Audit Report containing project details, audit findings, risk levels, recommendations, and overall assessment.
- Review the generated report, save/export it, and verify that the audit results are complete and accurate.

OUTPUT:

The image displays two screenshots of a Mendix application interface, likely for an IT Project Audit Report.

Top Screenshot: Welcome to your homepage

- Navigation Bar:** Home, risk, project, audit. Language: English, United States.
- Section 1: Define and organize your data**
 - Start by setting up your Domain Model, where you define the data structure for your app. This includes creating entities, attributes, and associations.
 - Domain model diagram:** Shows two entities, 'YourEntity' and 'YourEntity2', connected by an association. 'YourEntity' has attributes 'Endpoint (String)' and 'availability (String)'. 'YourEntity2' has attributes 'UUID (String)' and 'Status (enumeration)'.
 - Text: "A well-structured Domain Model forms the foundation for the components and pages you'll build next."
 - Link: → Learn more
- Section 2: Add and connect widgets to your page**
 - localhost:8080/# your data in place, start building your page by dragging widgets from the toolbox onto the canvas. Connect them to your data to make your app interactive and dynamic.
- Feedback button:** Located on the right side of the page.
